

Agenda

- z/OS Connect Introduction and overview
- Self paced, hands-on exercises to API enable z application from various sub-systems, e.g.
 - CICS
 - DB2
 - IMS/TM
 - MQ
 - IBM DVM
 - IBM File Manager
 - MVS Batch
 - Outbound REST APIs
 - 3270 screen based applications
- z/OS Connect Security

© 2018, 2019 IBM Corporation

z/OS Connect EE exposes z/OS resources to the “cloud” via RESTful APIs

 z/OS Connect EE

* Other Vendors or your own implementation

/what_is_REST?

What makes an API “RESTful”?

© 2018, 2019 IBM Corporation

REST is an Architectural Style

REST stands for **R**epresentational **S**tate **T**ransfer.

An architectural style for **accessing** and **updating** data.

Typically using HTTP... but not all HTTP interfaces are “RESTful”.

Simple and intuitive for the end consumer (**the developer**).

Roy Fielding defined REST in his 2000 PhD dissertation "Architectural Styles and the Design of Network-based Software Architectures" at UC Irvine. He developed the REST architectural style in parallel with HTTP 1.1 of 1996-1999, based on the existing design of HTTP 1.0 of 1996.

© 2018,2019 IBM Corporation

Key Principles of REST

Use HTTP verbs for Create, Read, Update, Delete (CRUD) operations

GET
POST
PUT
DELETE

`http://<host>:<port>/path/parameter?name=value&name=value`

Path and Query parameters are used for refinement of the request

URIs represent things (or lists of things)

Request/Response Body is used to represent the data object

```
GET http://www.acme.com/customers/12345?personalDetails=true
RESPONSE: HTTP 200 OK
BODY { "id" : 12345
      "name" : "Joe Bloggs",
      "address" : "10 Old Street",
      "tel" : "01234 123456",
      "dateOfBirth" : "01/01/1980",
      "maritalStatus" : "married",
      "partner" : "http://www.acme.com/customers/12346" }
```

© 2018,2019 IBM Corporation

REST vs RESTful

- REST is an architectural style of development having these principles plus..
- It should be stateless
- It should access all the resources from the server using only URI
- For performing CRUD operations, it should use HTTP verbs such as get, post, put and delete
- It should return the result only in the form of JSON
- REST based services follow some of the above principles and not all, whereas RESTful means it follows all the above principles.
- Remember - Not all REST APIs are RESTful APIs

© 2018,2019 IBM Corporation

7

Roast API Recipe

(How not to do REST...)

1. Take a SOAP/XML web service name, add a "/" before it.
2. Choose randomly an HTTP method between GET, PUT, POST, DELETE.
3. Transform input/output data from XML to JSON.
4. If the method is GET or DELETE, put all parameters in query variables.
5. And be sure to always return HTTP status 200.

© 2018,2019 IBM Corporation

Source: apihandyman.io

RESTful Examples

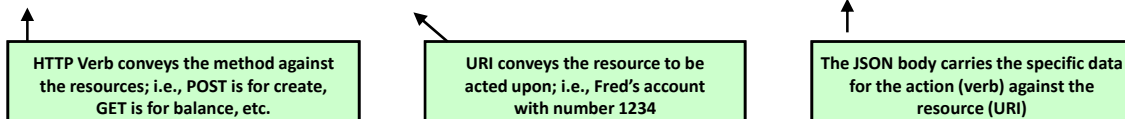

z/OS Connect Enterprise Edition:

POST /account?name=Fred + (JSON with Fred's information)

GET /account?number=1234

PUT /account?number=1234 + (JSON with dollar amount of deposit)

REST APIs are increasingly popular as an integration pattern because it is stateless, relatively lightweight, is relatively easy to program

<https://martinfowler.com/articles/richardsonMaturityModel.html>

© 2018,2019 IBM Corporation

Not every REST API is a RESTful API

(How to know if you are doing it wrong)

1. Unique URIs for different operations on the same object

POST <http://www.acme.com/customers/GetCustomerDetails/12345>

POST <http://www.acme.com/customers/UpdateCustomerAddress/12345?address=>

2. Different representations of the same objects

POST <http://www.acme.com/customers>

```
BODY { "firstName": "Joe",
       "lastName": "Bloggs",
       "addr": "10 Old Street",
       "phoneNo": "01234 0123456" }
```

RESPONSE HTTP 201 CREATED

```
BODY { "id": "12345",
       "name": "Joe Bloggs",
       "address": "10 New Street",
       "tel": "01234 0123456" }
```

3. Operational data in the request body

POST <http://www.acme.com/customers/12345>

```
BODY { "updateField": "address",
       "newValue": "10 New Street" }
```

RESPONSE HTTP 200 OK

```
BODY { "id": "12345",
       "name": "Joe Bloggs",
       "address": "10 New Street",
       "tel": "01234 123456" }
```

© 2018,2019 IBM Corporation

Why is REST popular?

Ubiquitous Foundation

It's based on HTTP, which operates on TCP/IP, which is a ubiquitous networking topology.

Relatively Lightweight

Compared to other technologies (for example, SOAP/WSDL), the REST/JSON pattern is relatively light protocol and data model, which maps well to resource-limited devices.

Relatively Easy Development

Since the REST interface is so simple, developing the client involves very few things: an understanding of the URI requirements (path, parameters) and any JSON data schema.

Increasingly Common

REST/JSON is becoming more and more a de facto "standard" for exposing APIs and Microservices. As more adopt the integration pattern, the more others become interested.

Stateless

REST is by definition a stateless protocol, which implies greater simplicity in topology design. There's no need to maintain, replicate or route based on state.

© 2018,2019 IBM Corporation

How do we describe a REST API?

© 2018, 2019 IBM Corporation

/swagger/open_api

The industry standard framework for describing RESTful APIs.

© 2018, 2019 IBM Corporation

Why use Swagger?

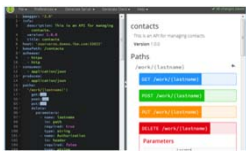

It is more than just an API framework

There are a number of tools available to aid consumption:

Write Swagger

Swagger Editor allows API developers to design their swagger documents.

Read Swagger

Swagger UI allows API consumers to easily browse and try APIs based on Swagger Doc.

Consume Swagger

Swagger Codegen create stub code to consume APIs from various languages

<https://blog.readme.io/what-is-swagger-and-why-it-matters/>

Why /zos_connect_ee?

Truly RESTful APIs to and from your mainframe.

© 2018, 2019 IBM Corporation

Can't we do REST and JSON today?

 z/OS Connect EE

© 2018, 2019 IBM Corporation

Yes, but....

 z/OS Connect EE

Completely different configuration and management.

Multiple endpoints for developers to call/maintain access to.

These are typically not RESTful!

© 2018, 2019 IBM Corporation

A single entry point is needed!

- ❑ Single Configuration Administration
- ❑ Single Security Administration
- ❑ With sophisticated mapping of truly RESTful APIs to existing mainframe and services data without writing any code.

© 2018, 2019 IBM Corporation

Let's Start with Data mapping

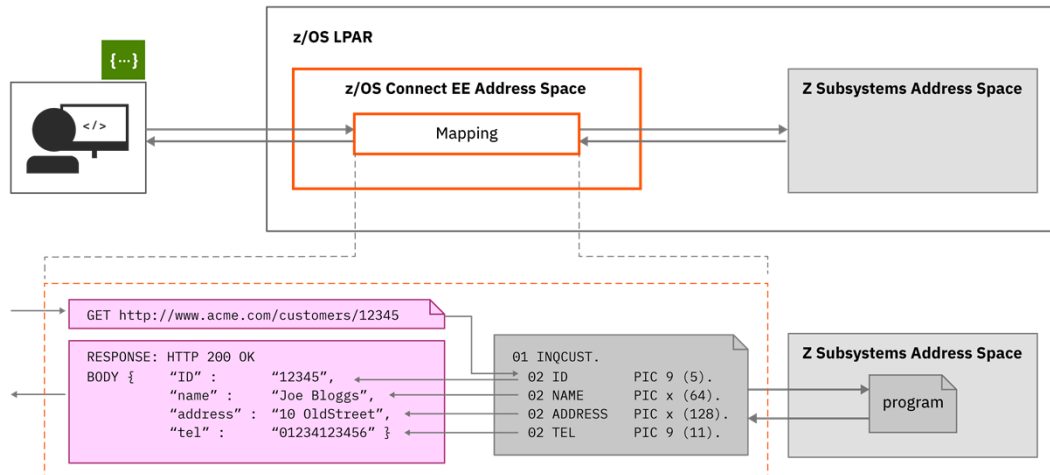

Converting from JSON to the target's subsystem's format

© 2018, 2019 IBM Corporation

Data mapping Example

A closer look

© 2018, 2019 IBM Corporation

COBOL versus JSON Example

```

01 MINILOAN-COMMAREA.
  10 name pic X(20).
  10 creditScore pic 9(16)V99.
  10 yearlyIncome pic 9(16)V99.
  10 age pic 9(10).
  10 amount pic 9999999V99.
  10 approved pic X.
      88 BoolValue value 'T'.
  10 effectDate pic X(8).
  10 yearlyInterestRate pic S9(5).
  10 yearlyRepayment pic 9(18).
  10 messages-Num pic 9(9).
  10 messages pic X(60) occurs 1 to 99 times
      depending on messages-Num.
  
```

```

"miniloan_commarea":{
  "type":"object",
  "properties":{
    "name":{
      "type":"string",
      "maxLength":20
    },
    "creditScore":{
      "type":"number",
      "format":"decimal",
      "multipleOf":0.01,
      "maximum":9999999999999999.99,
      "minimum":0
    }
  }
},
  
```

COBOL Source v JSON

“name”:”Mitch Johnson”,
 “creditScore”:100

All data is sent as character strings and numeric precision and sign bit is removed as an issue

Six Steps to expose a z/OS application

1. Create your service definition

To start mapping an API, z/OS Connect EE needs a representation of the underlying z/OS application: a **Service Archive file (.sar)**.

Use a system-appropriate utility to generate a **.sar** file for the z/OS application

- API Toolkit (CICS and IMS)
- BAQLS2JS (MQ and WOLA)
- z/OS Connect EE Build Toolkit (DB2 and HATS)
- DVM Toolkit

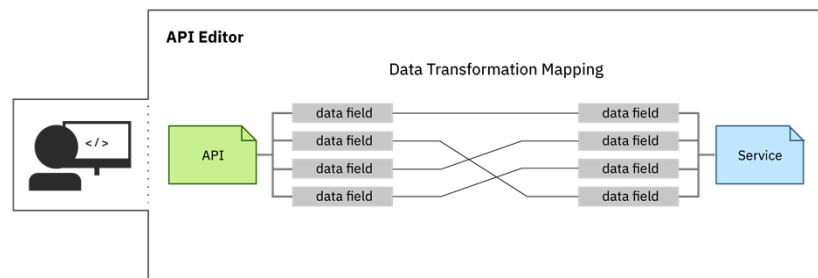

ibm.biz/zosconnect-sar-creation

© 2018,2019 IBM Corporation

Six Steps to expose a z/OS application

2. Create your API

Import your **.sar** file into the **API toolkit**, and start designing your API.

From the editor, create an **API Archive file (.aar)**, which describes your API and how it maps to underlying services.

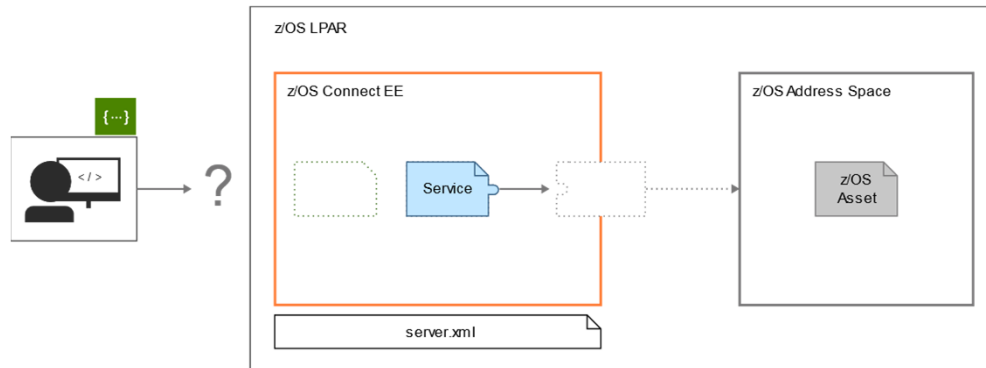

ibm.biz/zosconnect-create-api

© 2018,2019 IBM Corporation

Six Steps to expose a z/OS application

3. Deploy your service

Deploy the `.sar` file generated in **Step 2** using the right-click deploy in **the API toolkit**, or by copying the `.sar` file to the services directory.

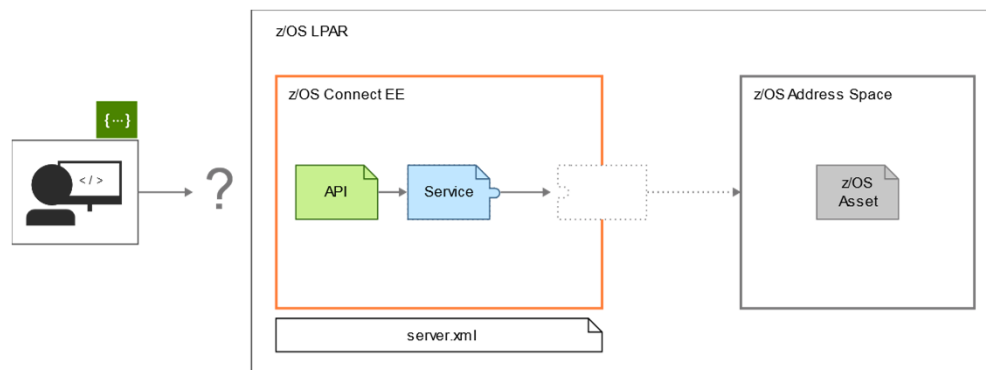

ibm.biz/zosconnect-define-services

© 2018, 2019 IBM Corporation

Six Steps to expose a z/OS application

4. Deploy your API

Deploy your API using the right-click deploy in **the API toolkit**, or by copying the `.aar` file to the `apis` directory.

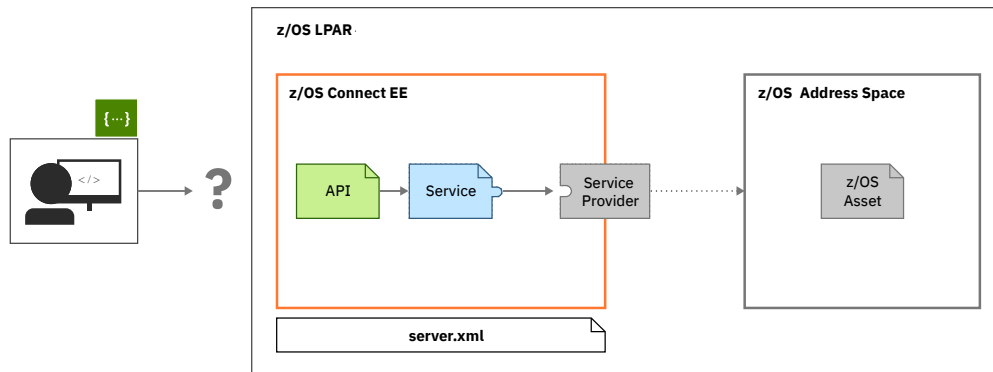

ibm.biz/zosconnect-deploy-api

© 2018, 2019 IBM Corporation

Six Steps to expose a z/OS application

5. Configure your service provider

Configure the system-appropriate service provider to connect to your backend system in your `server.xml`.

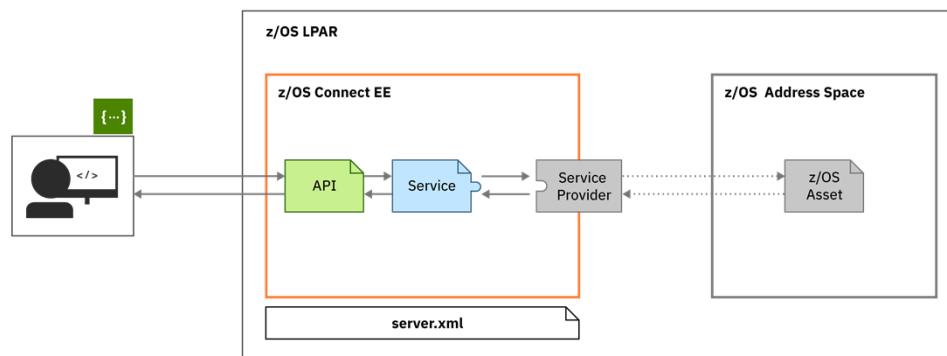

ibm.biz/zosconnect-configuring

© 2018, 2019 IBM Corporation

Six Steps to expose a z/OS application

6. Done

Your API is ready to be consumed: go tell your developers!

© 2018, 2019 IBM Corporation

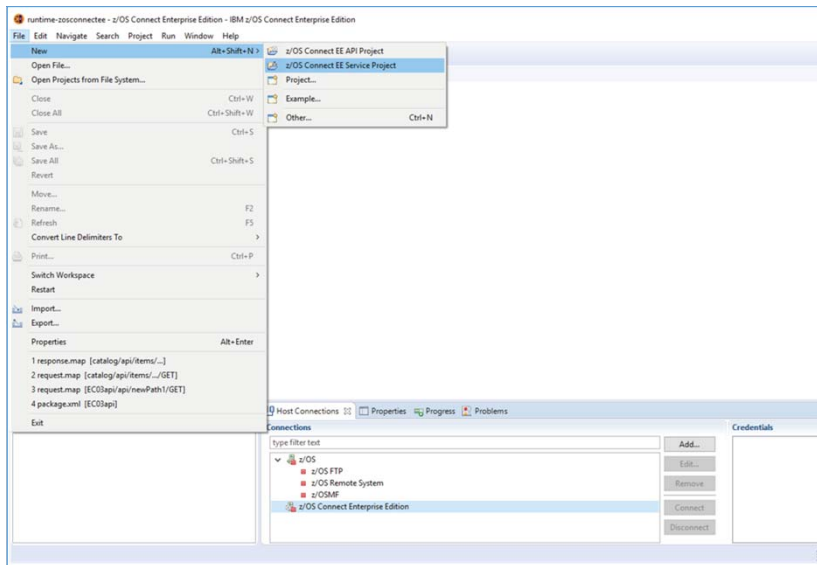

/api_toolkit/services

Simple **service creation**.

© 2018, 2019 IBM Corporation

API toolkit – Creating Services for CICS and IMS

Use the **API toolkit** to create services through Eclipse-based tooling.

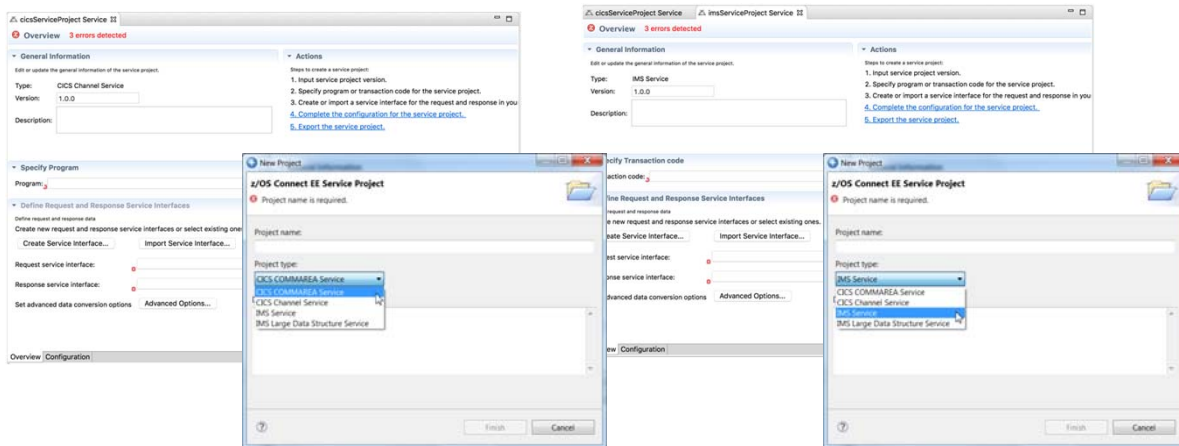

Services are described as **Projects**, so They can be easily managed in source control.

© 2018, 2019 IBM Corporation

API toolkit – Creating Services for CICS and IMS

Service creation – a common interface

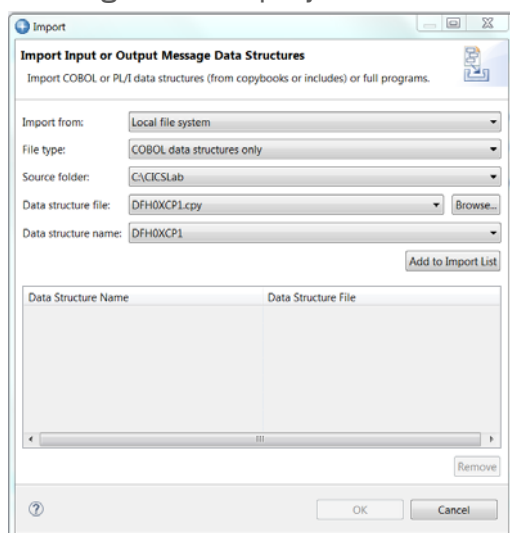

A common interface for service creation, agnostic of back end subsystem.

© 2018, 2019 IBM Corporation

API toolkit – Creating Services for CICS and IMS

Creating a service project

You start by importing data structures into the service interface from the local file system or the workspace.

The service interface supports complex data structures, including OCCURS DEPENDING ON and REDEFINES clauses.

API toolkit – Creating Services for CICS and IMS

Creating a service interface definition

Service Interface Definition

Define and customize your request and response service interfaces. Right-click a row and select the appropriate action from the context menu, or select a row and click the appropriate button.

Search:

Fields	Include	Interface rename	Default Field Value	Data Type	Field Length	Start Byte
COMMAAREA						
DFHOXCP1						
CA_REQUEST_ID	<input type="checkbox"/>	CA_REQUEST_ID	01INQS	CHAR	6	1
CA_RETURN_CODE	<input type="checkbox"/>	CA_RETURN_CODE		DECIMAL	2	7
CA_RESPONSE_MESSAGE	<input type="checkbox"/>	CA_RESPONSE_MESSAGE		CHAR	79	9
CA_REQUEST_SPECIFIC (Redefine)	<input type="checkbox"/>	CA_REQUEST_SPECIFIC		CHAR	911	88
CA_INQUIRE_REQUEST redefines	<input type="checkbox"/>	CA_INQUIRE_REQUEST		STRUCT	911	88
CA_INQUIRE_SINGLE redefines C	<input checked="" type="checkbox"/>	inquireSingle		STRUCT	911	88
CA_ITEM_REF_REQ	<input checked="" type="checkbox"/>	itemID		DECIMAL	4	88
FILL_0	<input type="checkbox"/>	FILL_0		DECIMAL	4	92
FILL_1	<input type="checkbox"/>	FILL_1		DECIMAL	3	96
CA_SINGLE_ITEM	<input type="checkbox"/>	CA_SINGLE_ITEM		STRUCT	60	99
FILL_2	<input type="checkbox"/>	FILL_2		CHAR	840	159
CA_ORDER_REQUEST redefines C	<input type="checkbox"/>	CA_ORDER_REQUEST		STRUCT	911	88

You can then see the imported data structure and can **redact fields**, **rename fields**, and **add default values to fields** to make the service more consumable for an API developer.

Creating Services without the Toolkit - 1

For MQ and MVS Batch use the supplied conversion utility BAQLS2JS

BIND Files

These are binary-format files that contain information about the field definitions and the data transformation requirements.

These are placed in a USS file system location based on input parms you specify.

JSON Schema Files

These provide the JSON schema used to interact with the backend program based on the COPYBOOK data requirements.

These are placed in a USS file system location based on input parms you specify.

Service Archive (SAR) File

This is a ZIP-format file that contains the JSON schema and some meta-data. This is input to the API Editor (next unit) to create the APIs.

This is placed in a USS file system location based on input parms you specify.

Creating Services without the Toolkit – Part 3

For DVM use the DVM Studio

© 2018, 2019 IBM Corporation

Once we have a Service Archive (SAR) What's next?

Quick and easy **API mapping**.

*Remember: All service archives files are functionally equivalent
regardless of how there are created*

© 2018, 2019 IBM Corporation

/api_toolkit/api_editor

Quick and easy **API mapping**.

© 2018, 2019 IBM Corporation

API toolkit – API Editor

API definition

The screenshot shows the 'z/OS Connect EE API Editor' window. It has a tab for 'catalog API'. Under 'Describe your API', there are fields for Name (catalog), Base path (/catalogManager), Version (1.0.0), and Description (APIs for browsing, inquiring and ordering items from a catalog). Below this, there are two sections for defining API methods. The first section has a Path field with '/items?startItem' and a Methods list with GET (InquireCatalog) and POST (placeOrder). The second section has a Path field with '/items/{itemID}' and a Methods list with GET (InquireSingle), PUT (InquireSingle), and DELETE (InquireSingle). Each method entry has buttons for 'Service...' and 'Mapping...'.

The **API toolkit** is designed to encourage RESTful API design.

Once you define your API, you can map backend services to each request.

Your services are represented by **.sar** files, which you import into the **API toolkit**, regardless of how the .sar was generated.

© 2018, 2019 IBM Corporation

API toolkit – API Editor

API mapping: Point-and-click interface

The screenshot shows the 'API mapping' interface. On the left, there's a tree view for 'catalogManager API' with a selected 'GET .item(.item)' endpoint. Below it, a list of fields for the request is shown, including HTTP Request, HTTP Headers, Authorization, Path Parameters, Query Parameters, and Body. On the right, there's a 'Updates' section with a 'Click to filter...' button and a list of fields for the response, including 'InquireSingle' and 'itemID'. A 'Move' button is used to map fields between the request and response.

Map both the request and response for each API.

Map path and query parameters to native data structures.

Assign static values to fields, useful for Op codes.

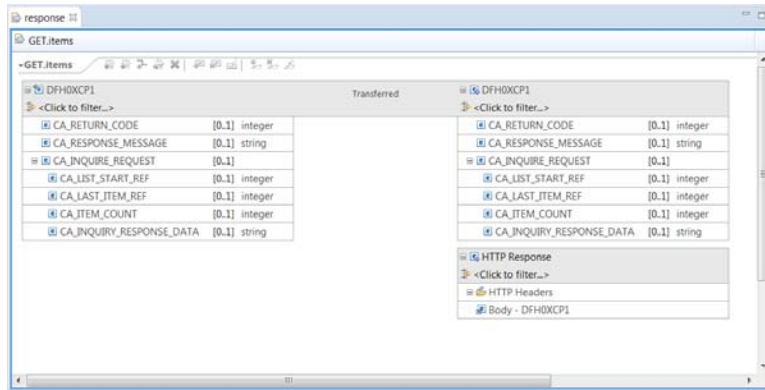

Remove unwanted fields to simplify the API (remember request was set to 01INQC in the SAR).

© 2018, 2019 IBM Corporation

API toolkit – API Editor

Tour of Server Configuration Directories and Files

A z/OS Connect EE V3.0 server configuration structure looks like this:

/var/zosconnect/servers/<server_name>

© 2018, 2019 IBM Corporation

Connect to CICS

Create the service definition

.sar file is created from a copybook using the Eclipse-based **API toolkit service project editor**.

ibm.biz/zosconnect-sar-creation

© 2018, 2019 IBM Corporation

Connect to CICS

Topology

Connection to CICS is configured in `server.xml`.

An IPIC connection must be configured in CICS.

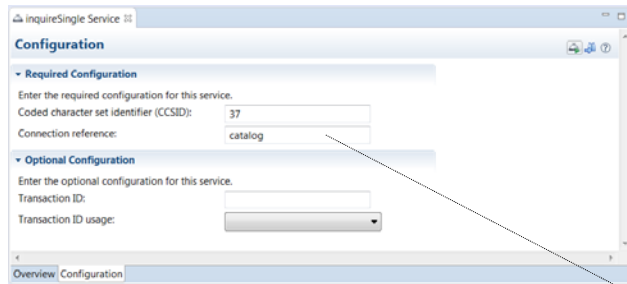

ibm.biz/zosconnect-scenarios

© 2018, 2019 IBM Corporation

The server.xml File (CICS IPIC)

The server.xml file is the key configuration file:

Define IPIC connection to CICS

Features are functional building blocks. When configured here, that function becomes available to the Liberty server

catalog.xml

Design Source

```

1 <server description="CICS IPIC - catalog">
2
3 <!-- Enable features -->
4 <featureManager>
5   <feature>zosconnect:cicsService-1.0</feature>
6 </featureManager>
7
8 <zosconnect_cicsIpicConnection id="catalog"
9   host="wg31.washington.ibm.com"
10  port="1491"/>
11
12 </server>
13
  
```

The IMS server.xml file ...

Connect to IMS

Create the service definition

.sar file is created from a copybook using the Eclipse-based **API toolkit service project editor**.

ibm.biz/zosconnect-sar-creation

© 2018, 2019 IBM Corporation

Connect to IMS

Topology

Configure the connection to IMS through `ims-connections.xml` and `ims-interactions.xml` in the IMS service registry.

Use the **API toolkit** to configure the service.

ibm.biz/zosconnect-scenarios

© 2018, 2019 IBM Corporation

IMS Connections and Interactions

Connection

```

<server>
<imsmobile_imsConnection comment="" connectionFactoryRef="IVP1" connectionTimeout="-1" connectionType="IMSCONNECT" id="IMSCONN"/>
<connectionFactory containerAuthDataRef="Connection1_Auth" id="IVP1">
  <properties.gmoa hostName="wg31.washington.ibm.com" portNumber="4000"/>
</connectionFactory>
<authData id="Connection1_Auth" password="encryptedPassword1" user="userName1"/>
</server>

```

Interaction

```

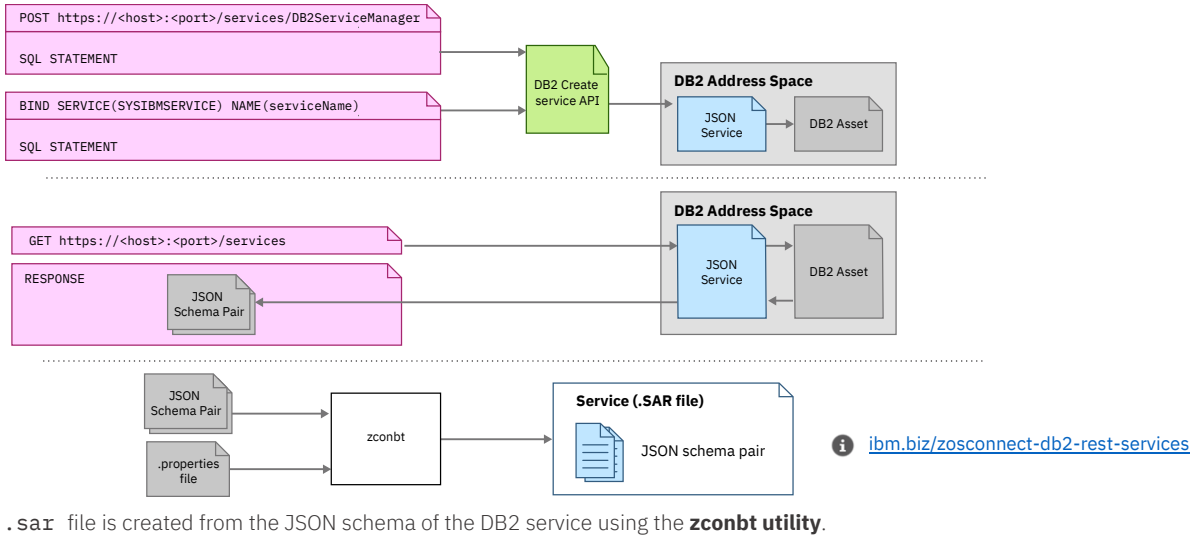

<server>
<imsmobile_interaction comment="" commitMode="1" id="IMSINTER" imsConnectCodepage="Cp1047" imsConnectTimeout="0"
  imsDatastoreName="IVP1" interactionTimeout="-1" ltermOverrideName="" syncLevel="0"/>
</server>

```

Connect to Db2

Create the service definition

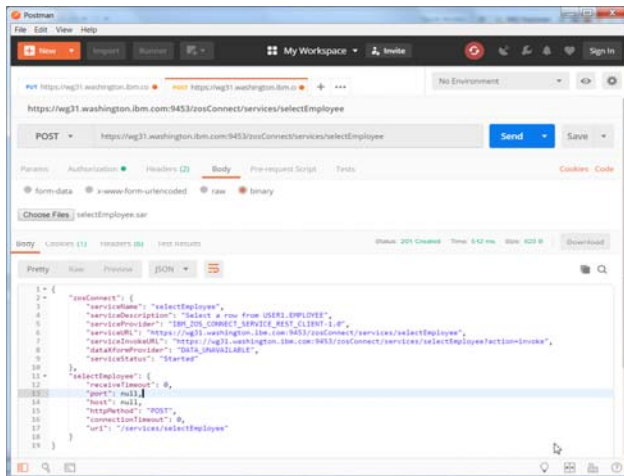

© 2018, 2019 IBM Corporation

Deploying Db2 Service Archive Options

- Use SAR as request message and use HTTP POST
- Use URI `/zosConnect/services/{serviceName}`
- Postman or curl://

Command:

```
curl --data-binary @selectEmployee.sar
--header "Content-Type: application/zip"
https://mpxm:9453/zosConnect/services/selectEmployee
```

Results:

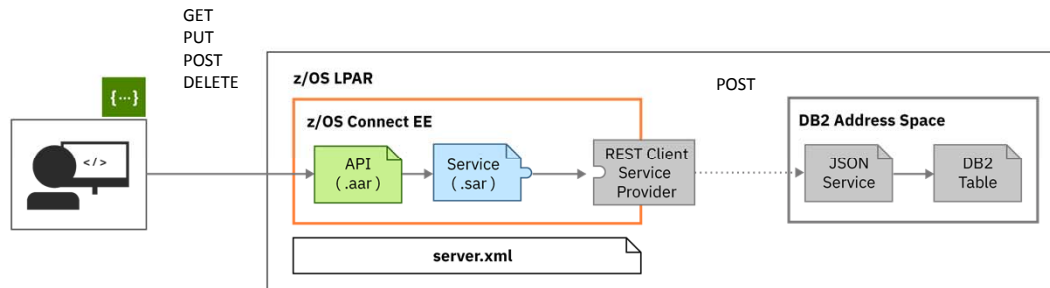

```
{
  "zosConnect": {
    "serviceName": "selectEmployee",
    "serviceDescription": "Select a row from USER1.EMPLOYEE",
    "serviceProvider": "IBM_ZOS_CONNECT_SERVICE_REST_CLIENT-1.0",
    "serviceInvokeURL": "https://mpxm:9453/zosConnect/services/selectEmployee?action=invoke",
    "dataXformProvider": "DATA_UNAVAILABLE",
    "serviceStatus": "Started",
    "selectEmployee": {
      "receiveTimeout": 0,
      "port": null,
      "host": null,
      "httpMethod": "POST",
      "connectionTimeout": 0,
      "uri": "/services/selectEmployee"
    }
  }
}
```

Connect to Db2

Topology

Connection to the JSON Service is configured in `server.xml`.

A JSON Service must be configured in DB2.

ibm.biz/zosconnect-db2-rest-services

© 2018, 2019 IBM Corporation

The server.xml File (Db2)

The `server.xml` file is the key configuration file:

db2pass.xml

```

Design    Source
1 <server description="DB2 REST">
2
3 <zoscconnect_zosConnectServiceRestClientConnection id="db2conn"
4   host="wg31.washington.ibm.com"
5   port="2446"
6   basicAuthRef="dsn2Auth" />
7
8 <zoscconnect_zosConnectServiceRestClientBasicAuth id="dsn2Auth"
9   applName="DSN2APPL"/>
10
11 </server>
12

```

```

DSNL004I  -DSN2 DDF START COMPLETE
          LOCATION  DSN2LOC
          LU        USIBMWZ.DSN2APPL
          GENERICLU -NONE
          DOMAIN    WG31.WASHINGTON.IBM.COM
          TCPPORT   2446
          SECPOR    2445
          RESPOR    2447

```

API Policies

z/OS Connect EE

- HTTP header properties can be used to select alternative IMS regions (V3.0.4) or CICS (V3.0.10)
- Policies can be configured globally for every API in the server or for individual APIs (V3.0.11)

© 2018, 2019 IBM Corporation

Liberty's “adminCenter” Feature

Web browser interface to the server's configuration files

© 2018, 2019 IBM Corporation

RESTful Administrative Interface for Services

The administration interface for services is available in paths under `/zosConnect/services`.

Most administration tasks are supported by the RESTful administration interface

Method	Administrative Task
GET	Get details of a service
	Get the status of a service
	Get the request schema of a service
	Get the response schema of a service
POST	Deploy a service*
PUT	Update a service
	Change the status of a service
DELETE	Delete a service

PUT `/zosConnect/services/{serviceName}?status=started|stopped`

GET `/zosConnect/services`

GET `/zosConnect/services/{serviceName}`

*Useful for deploying DB2 and HATS service archive files

© 2018, 2019 IBM Corporation

RESTful Administrative Interface for APIs

The administration interface for services is available in paths under /zosConnect/apis.
Most administration tasks are supported by the RESTful administration interface

Method	Administrative Task
GET	Get a list of APIs
	Get the details of an API
POST	Deploy an API
PUT	Update an API
	Change the status of an API
DELETE	Delete aa API

PUT /zosConnect/apis/{apiName}?status=started|stopped
GET /zosConnect/apis
GET /zosConnect/apis/{apiName}

© 2018, 2019 IBM Corporation

RESTful Administrative Interface for API Requesters

The administration interface for services is available in paths under /zosConnect/apisRequesters.
Most administration tasks are supported by the RESTful administration interface

Method	Administrative Task
GET	Get a list of API Requesters
	Get the details of an API Requester
POST	Deploy an API Requester
PUT	Update an API Requester
	Change the status of an API Requester
DELETE	Delete aa API Requester

PUT /zosConnect/apiRequesters/{apiRequesterName}?status=started|stopped
GET /zosConnect/apiRequesters
GET /zosConnect/apiRequesters/{apRequesterName}

Performance

High Speed, High Throughput, Low Cost

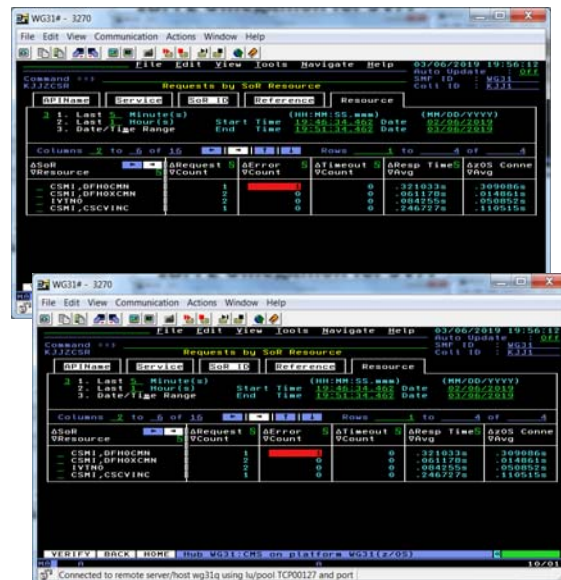

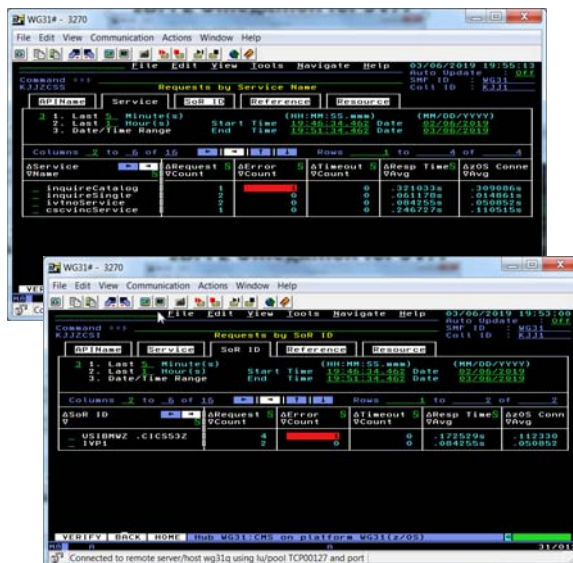

z/OS Connect EE is a Java-based product: Over **99%** of its MIPs are **eligible for ZIIP offload**.

ibm.biz/zosconnect-performance-report

© 2018, 2019 IBM Corporation

IBM z Omegamon for JVM

© 2018, 2019 IBM Corporation

Authentication

Several different ways this can be accomplished:

Basic Authentication

Server prompts for ID/PW

Client supplies ID/PW

Server checks registry:

- Basic (server.xml)
- LDAP
- SAF

Client Certificate

Server prompts for cert.

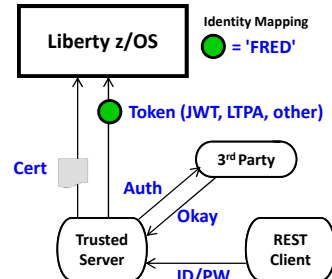

Client supplies certificate

Server validates cert and maps to an identity

Registry options:

- LDAP
- SAF

Third Party Authentication

Client authenticates to 3rd party sever

Client receives a trusted 3rd party token

Token flows to Liberty z/OS and is mapped to an identity

Registry options:

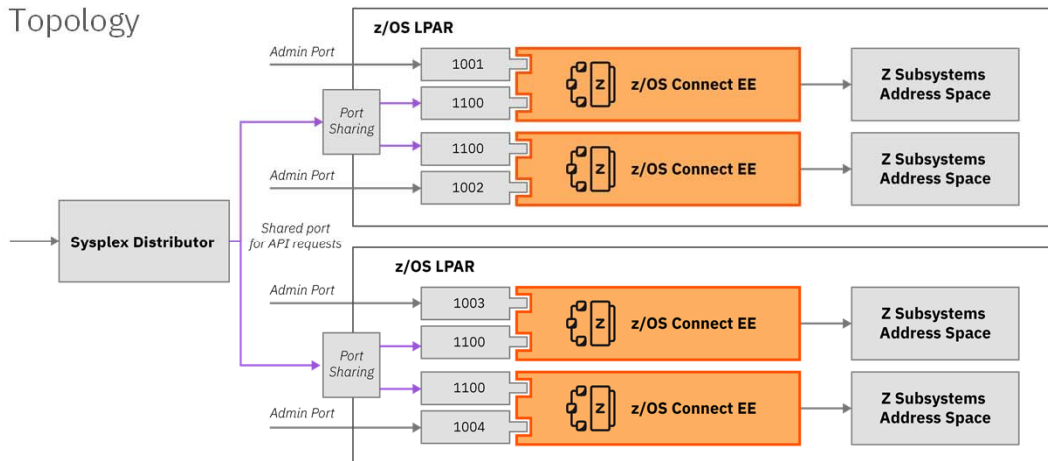

- LDAP
- SAF

What Does Liberty and z/OS Connect Provide?

A framework to secure and manage access to z/OS resources using REST:

1. Liberty is provided as a runtime. This is significant because the capabilities of Liberty are available to z/OS Connect EE V3.0 which runs inside, notably: security
2. Backend connectivity is provided with "service provider" code. The connectivity mechanism is a function of the backend system: CICS=IPIC; IMS=TCP; DB2=RESP; MQ=JMS; BATCH=WOLA
3. These are "interceptors" and provide function that is called for each request that arrives.
4. Both the "service provider" and "interceptor" interfaces are extensible, allowing you to write your own, or for third party vendors to write code and use z/OS Connect EE V3.0

Exercises – Two paths or options

z/OS Connect EE

- ☐ Basic Configuration Hands-on Lab
 - ☐ Configure a z/OS Connect Server
 - ☐ Develop and deploy a Service
 - ☐ Develop and deploy an API
 - ☐ Test using Swagger UI
 - ☐ Enable Security (SAF and SSL)

Or one or more of the following:

- ☐ Developing APIs Hands-on Labs
 - ☐ CICS Container/COMMAREA
 - ☐ DB2
 - ☐ IMS Transaction
 - ☐ MQ
 - ☐ MVS Batch
 - ☐ HATS
 - ☐ IBM DVM
 - ☐ Outbound RESTful applications

- Material can be downloaded from:

<https://github.com/ibm-wsc/zCONNEE-Wildfire-Workshop>

- Copy/Paste files on desktop
 - Basic Configuration CopyPaste
 - Developing APIs CopyPaste

- Identities:
 - RACF: USER1/USER1
 - zCEE: Fred/fredpwd

- 3270 Key Sequences
 - Clear screen: Fn-P
 - Enter key: right CTRL
